SITUATION SUMMARY

California Department of Public Health Zika Virus Disease Update

The Medical and Health Coordination Center (MHCC) continues to be activated in response to the Zika Virus Disease (Zika) in order to aggregate and update information from a variety of sources and coordinate response activities across the California Department of Public Health (CDPH).

- Local transmissions of several cases of Zika in an area near Miami, Florida have been confirmed and are being contained. These are the first cases of Zika virus transmission from mosquitoes in the continental United States.
- The Medical and Health Coordination Center (MHCC) continues to be activated in response to the Zika virus disease (Zika) in order to aggregate and update information from a variety of sources and coordinate response activities across the California Department of Public Health (CDPH). CDPH centers and programs are providing information related to their specific activities on a weekly basis. This information is being collected and included in a weekly Public Health and Medical Emergency Function (EF) 08 Situation Report released by the MHCC. The MHCC is managing requests for information from the public, healthcare facilities, and Local Health Departments (LHDs) to ensure responses are timely and accurate.
- Zika is transmitted to people primarily through the bite of an infected *Aedes aegypti* mosquito (also known as yellow fever mosquitoes) and *Aedes albopictus* mosquito (also known as Asian tiger mosquitoes), which are not native to California. Today, 54 countries have documented Zika virus transmission, with over 40 reporting their first outbreak within recent months. The most common symptoms of Zika virus are fever, rash, joint pain, and conjunctivitis. People do not consistently get sick enough to seek treatment at a hospital, and the mortality rate for Zika is extremely low. For this reason, many people might not realize they have been infected. However, Zika virus infection during pregnancy can cause a serious birth defect called microcephaly, a condition where a baby's head is much smaller than normal, as well as other severe fetal brain defects.
- The Centers for Disease Control and Prevention (CDC), CDPH, Emergency Medical Services Authority (EMSA), California Governor's Office of Emergency Services (Cal OES), and State level EF 08 partners are preparing for the management of Zika cases in California. Reporting of select notifiable diseases is mandated by State law in California through Title 17 California Code of Regulations and Zika virus is now classified as a notifiable disease that must be reported. CDPH is working with the healthcare community and local health jurisdictions to identify potential suspect cases and avoid spreading of the disease. New and updated guidelines released by CDC are posted on the CDPH website available at: (<http://www.cdph.ca.gov/HealthInfo/discond/Pages/Zika.aspx>).
- CDC has established a national US Zika Pregnancy Registry to address questions about Zika-associated birth defects and other pregnancy outcomes. All data reported to the U.S. Zika Pregnancy Registry will be de-identified and healthcare provider participation is voluntary. CDPH is participating in the U.S. Zika Pregnancy Registry and is the point of contact for California data submission to CDC. CDPH is working with local health departments and healthcare providers to complete the U.S. Zika Pregnancy Registry data collection forms for submission to CDC.
- EMSA and the EMSA Duty Officer Program are monitoring the situation and remain in communication with the Regional Disaster Medical and Health Coordination (RDMHC) and Medical Health Operational Area Coordination (MHOAC) Programs throughout California.
- Please see attached for full report.

WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

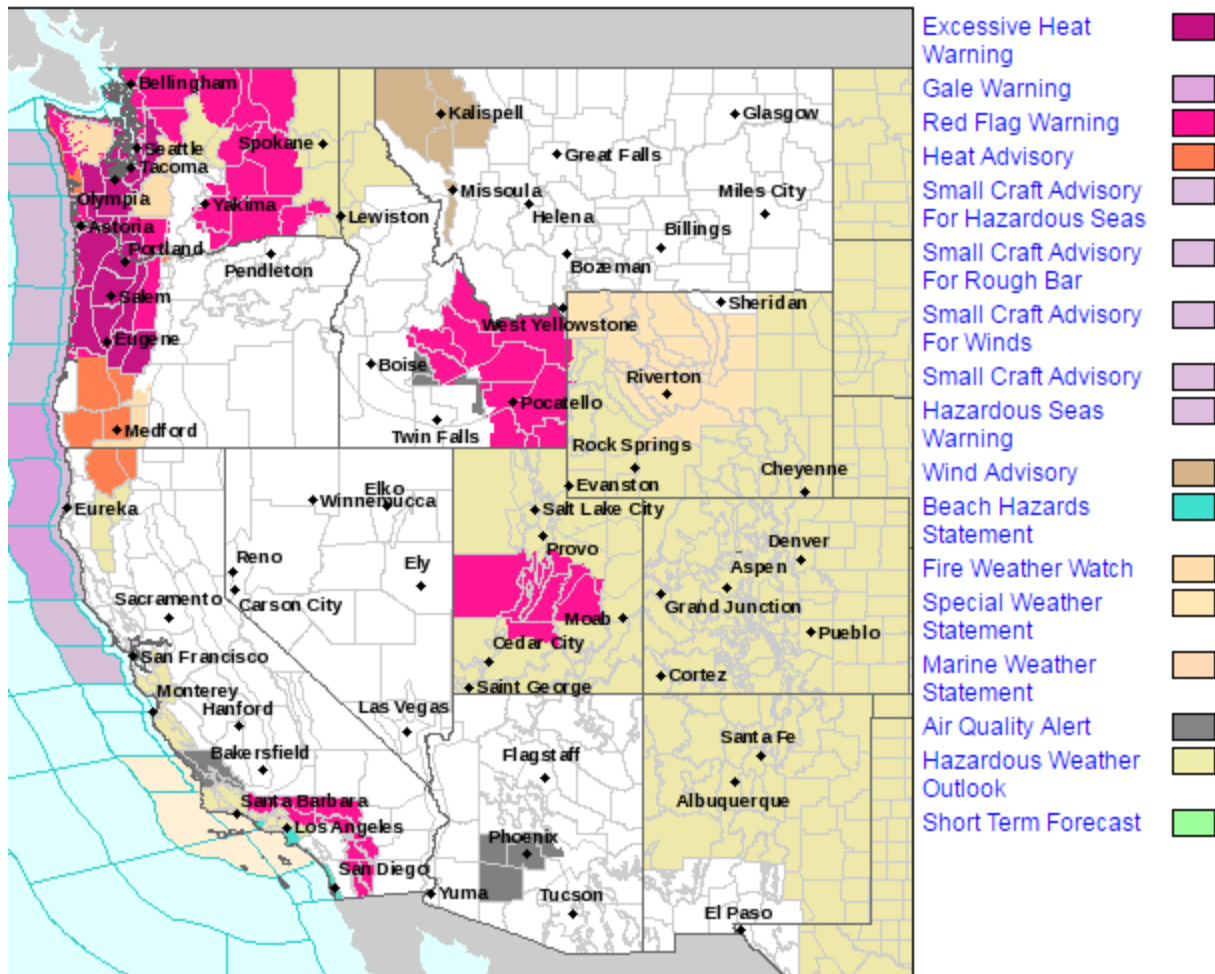

A weak trough will continue to affect the region for the next few days as it moves slowly south. Isolated afternoon and evening thunderstorms are expected to develop again today over our northern and eastern mountains and should be the most numerous of any day this week. Isolated afternoon and evening thunderstorms will return Thursday, but the focus will more likely be over the eastern mountains and then possibly our more southern areas late in the day. This could include the Sierra foothills in the evening and a very small chance of a few thunderstorms or light showers overnight in the southern Sacramento Valley westward. Some rain will likely occur with thunderstorms over the next few days, but dry lightning strikes are also expected. High pressure over the Pacific will nose eastward and drop into the region from the northwest Friday and Saturday. This will dry up the chances of thunderstorms for the most part, although it appears a small chance of isolated ones in the Lake Tahoe area will linger. Sunday and Monday the southern edge of a low pressure trough moving into the Pacific Northwest should affect the region and return a slight chance of isolated afternoon and evening thunderstorms to our eastern areas. Drier, cooler weather looks likely next Tuesday. Some gusty north to east winds with relatively low afternoon relative humidity (RH) and poor overnight recovery will continue over the mountains in far northwest California into early Thursday with gusts mostly reaching around 25 mph. Elsewhere, winds will be quite light, rather unseasonably so over our eastern areas in the afternoons. The warmest inland valleys will be 5-10 degrees above normal for the next few days, mostly around 105-108 before settling into somewhat cooler and just slightly above normal temperatures late this weekend and early next week. Overnight RH recovery will still remain between 30-45% for many areas, especially mid and upper slopes and away from the marine layer. The marine layer will continue at about 1200-1800 feet deep most days with daily overnight and morning low clouds and patchy fog pushing ashore furthest in the Humboldt Bay area and the greater Bay Area locations.

SOUTHERN CALIFORNIA

A weak trough will result in a very gradual cool down through the rest of the week into the weekend. Yesterday, most locations were 2-3 degrees cooler and expect a similar amount of cooling each day through Saturday. By the weekend, high temperatures will be in the 70s in the mountains above 5,000 feet to the lower to mid 90s in the valleys and foothills. However, relative humidity (RH) will continue to be very low today and again Friday. RH recovery last night was a bit better than the last two nights, but still quite poor over the Sierras and most of interior sections of Southern California. Readings will be back in the single digits before noon across Southern California away from the coast. Minimum RH will reach the single digits as well in the Sierras during the afternoon hours. West and southwest winds of 15-25 mph with gusts to 40 mph will continue across the Antelope Valley, the north sides of the Angeles and San Bernardino National Forest as well as the Banning Pass and Cleveland National Forest. Late this afternoon, one or two thunderstorms will be possible near the Sierra Crest from Yosemite National Park northward. There will also be some scattered storms over the far eastern desert this afternoon and evening. Tonight, RH recovery will be slightly better and minimum RH may be 2-5% higher Friday afternoon. Isolated storms will be possible along the Sierra Crest Friday into the weekend with the best chance of storms likely being Saturday. Winds are expected to be light across all areas by Saturday. Temperatures may warm up a bit early next week, but no excessively hot temperatures are expected. It may turn breezy along the central coast during the middle to latter portions of next week.
